

Development of digital solutions for platforms in focus

Embedded VISION Europe Conference – October 24th and 25th, 2019 in Stuttgart

hema was able to gain informative news from the embedded vision technology industry and valuable contacts at this year's Embedded VISION Europe Conference (EVE for short). The event for product developers and embedded vision users took place at the end of October in Stuttgart.

hema electronic was represented by sales manager Hartmut Müller. As one of a total of 20 companies, hema presented its hardware and development solutions for embedded vision projects at a table top.

Visitors and press representatives from various trade media showed interest in the Aalen-based company's ICAM camera systems and development services. Hartmut Müller sees great future potential in this: "Platforms with embedded vision technology increasingly include the integration of digital solutions such as Artificial Intelligence or methods such as Deep Learning using various algorithms. In the future, we could envisage increased cooperation with providers of these solutions for the optimal use of platforms."

The company would also like to use the media interest in hema's services to its advantage in the coming months and align its marketing and communication activities accordingly.

About hema electronic

hema electronic GmbH – the embedded vision expert

hema is a leading development service provider in the electrical industry, providing hardware and software design for embedded vision boards and systems for applications in industrial automation, defence and security. From consulting and conception to design (FPGAs, DSPs, embedded processors), qualifications, rapid prototyping and small series production up to lifecycle management – hema offers everything from one source. hema supports their customers effectively in being the world market leaders of tomorrow.
